(57) Abstract

This application describes a high throughput assay for screening compounds which are capable of binding to a fusion protein which consists of a target protein and an FK506-binding protein. This application also describes an assay for screening compounds which inhibit a protease.

TITLE OF THE INVENTION A HIGH THROUGHPUT ASSAY USING FUSION PROTEINS

BACKGROUND OF THE INVENTION

5

10

Several assays have been developed that screen compounds to determine if they are capable of binding to a fusion protein. One such method uses heterobifunctional cross-linking with diamino-europium-cryptate and a protein of interest. However, the activity of the protein is often affected by the modification with the heterobifunctional cross-linking agents. These methods also require an

heterobifunctional cross-linking agents. These methods also require ar additional purification for the heterogeneous products resulting from the covalent modifications of the proteins.

A new method, Homogeneous Time-Resolved Fluorescence (HTRF), combines the benefits of a fluorescent label and a homogeneous 15 assay protocol in a high throughput screen. HTRF uses a pair of chemically stable labeling molecules, such as a lanthanide cryptate and a fluorescent molecule. Specifically, europium cryptate (Eu(K)) and XL-665 have been used to label biomolecules. XL-665 is a cross-linked derivative of allophycocyanin, a red-green algae pigment. HTRF works 20 by measuring the change in fluorescent energy. If XL-665 is in proximity to Eu(K), it will yield an amplified and long-lived signal. The amount of energy transfer is a function of proximity of the two molecules. Eu(K) has a long-lived fluorescent signal which facilitates the homogeneous nature of the assay. A time delay in reading the signal 25 eliminates the principal difficulty in applying fluorescence to screening formats. This technology is useful in both binding and protease assays. [Kolb et al., J. of Biomolecular Screening, 1, No. 4, 203-210 (1996); Kolb et al., Pharm. Manuf. Int., p. 31 (1996)]

30 SUMMARY OF THE INVENTION

The instant invention relates to a method of screening that can be used to determine if compounds are capable of binding to a protein or are capable of blocking ligand-protein or protein-protein interactions. The instant invention covers a method of screening for

compounds capable of binding to a fusion protein which comprises combining a test compound, a biotinylated ligand, a fusion protein (target protein, peptide linker and FK506-binding protein), a donorlabeled ligand, and acceptor-labeled streptavidin, and then measuring the fluorescence attributable to the binding of the biotinylated ligand to the fusion protein in the presence of the test compound relative to a control assay in the absence of the test compound, so as to determine the effect the test compound has on the binding of the biotinylated ligand. The instant invention also covers a method of screening for compounds which inhibit a protease which comprises combining a test compound, a 10 fusion protein substrate (reporter protein, peptide linker and FK506binding protein), a protease, a donor-labeled ligand, and acceptorlabeled streptavidin, and then measuring the fluorescence attributable to the binding of the intact fusion protein substrate in the presence of the 15 test compound relative to a control assay in the absence of the test compound, so as to determine the effect the test compound has on proteolytic activity. This invention provides an immediate means of making use of HTRF technology for the functional assay of either ligand binding to a single or multiple signal transduction domain(s), tyrosine 20 phosphatases, nuclear receptors or bacterial tRNA synthetases in a signal increase assay or proteolytic activity in a signal decrease assay. The present invention is readily adaptable to robotic automation for high capacity screening for agonists, antagonists, and/or inhibitors.

5

15

DETAILED DESCRIPTION OF THE INVENTION

The present invention relates to a method of screening for compounds which preferentially bind to a target protein or inhibit a protease.

As depicted in Figure 1, an embodiment of this invention is a method of screening for compounds capable of binding to a fusion protein which comprises the steps of:

- a) mixing a test compound, a biotinylated ligand, the fusion protein, a donor-labeled ligand and acceptor-labeled streptavidin;
- b) incubating the mixture for an appropriate time;
- c) measuring the time-resolved fluorescence attributable to the binding of the biotinylated ligand to the fusion protein in the presence of the test compound; and
- d) determining the binding of the biotinylated ligand to the fusion protein in the presence of the test compound relative to a control assay run in the absence of the test compound.

As depicted in Figures 2 and 3, another embodiment of this invention is a method of screening for compounds capable of inhibiting a protease which comprises the steps of:

- a) mixing a test compound, a fusion protein substrate, a donor-labeled ligand, acceptor-labeled streptavidin, and a protease;
- b) incubating the mixture for an appropriate time;
 - c) measuring the time-resolved fluorescence attributable to the binding of the intact fusion protein substrate to the acceptor-labeled streptavidin in the presence of the test compound; and

d) determining the binding of the intact fusion protein substrate to the acceptor-labeled streptavidin in the presence of the test compound relative to a control assay run in the absence of the test compound.

5

30

For Figures 1-3, the following definitions apply to the terms used therein:

Eu(K) = Europium Cryptate

10 "506" = FK506 analog

FKBP = FK506 Binding Protein

SH2 = Src homology domain 2

12-mer = phosphotyrosine-containing, 12 peptide

B = biotin

15 $(SH2)_2$ = tandem SH2 domains of ZAP70

ITAM = bisphospotyrosine-containing, 25 residue peptide

SA = streptavidin

The term "fusion protein" refers to a "target protein" fused to an "FK506-binding protein" (FKBP), the two proteins being separated by a "peptide linker". The term "fusion protein substrate" refers to a "reporter protein" fused to an FKBP, the two proteins being separated by a peptide linker.

A "peptide linker" may consist of a sequence containing
from about 1 to about 20 amino acids, which may or may not include
the sequence for a protease cleavage site. An example of a peptide
linker which is a protease cleavage site is represented by the amino acid
sequence GLVPRGS. (SEQ. ID. NO. 1).

The term "protease" refers to an enzyme that catalyzes the hydrolytic breakdown of proteins and/or peptides. Examples of proteases may include, but are not limited to, thrombin, Human Immunodeficiency Virus (HIV) protease and Tumor Necrosis Factor (TNF) α converting enzyme.

The term "target protein" refers to any protein that has a defined ligand. Types of target proteins include, but are not limited to, tyrosine phosphatases (FKBP-phosphatase chimera as receptor and biotinylatedpeptide containing a phosphonomethylene isostere as ligand), nuclear receptors (FKBP-receptor and biotinylated DNA) and bacterial tRNA synthetases (FKBP-tRNA synthetase and biotinylated tRNA). Also included within this definition of target protein are single and multiple signal transduction domains, such as, but not limited to, Src homology 1 (SH1), Src homology 2 (SH2), Src homology 3 (SH3), and pleckstrin homology (PH) domains [Hanks & Hunter, FASEB J., 9, 576-596 (1995); Bolen, Curr. Opin. Immunol., 7, 306-311 (1995); Kuriyan & Cowburn, Curr. Opin. Struct. Biol., 3, 828-837 (1993); Cohen et al., Cell, 80, 237-248 (1995)]. The term "SH1 domain" refers to a family of homologous protein domains that bind ATP and catalyze tyrosine phosphorylation of peptide and protein substrates. The term "SH2 domain" refers to a family of homologous protein domains that share the common property of recognizing phosphorylated tyrosine residues in specific peptide contexts. The term "SH3 domain" refers to a family of homologous protein domains that share the common property of recognizing polyproline type II helices. The term "PH domain" refers to a family of homologous protein domains that mediate both proteinprotein and protein-lipid interactions. Examples of SH2 domains which may be utilized in the method of the invention include, but are not limited to, the single and tandem SH2 domains present in the tyrosine kinases ZAP70, Syk and Lck. The DNA sequences were obtained from GenBank, National Center for Biotechnology Information, National Library of Medicine, 8600 Rockville Pike, Bethesda, MD 20894. The Accession Numbers for the sequences are: human ZAP70 (L05148) human Syk (L28824) and human Lck (X13529). The sequences for ZAP70, Syk and Lck are disclosed in the sequence listing as follows: the isolated DNA encoding for a fusion protein containing ZAP70 is (SEQ. ID. NO. 2); the isolated DNA encoding for a fusion protein containing Syk is (SEQ. ID. NO. 3); the isolated DNA encoding for a fusion protein containing Lck is (SEQ. ID. NO. 4); the sequence for the

10

15

20

25

30

FKBP-ZAP70:SH2 fusion protein is (SEQ. ID. NO. 5); the sequence for the FKBP-Syk:SH2 fusion protein is (SEQ. ID. NO. 6); and the sequence for the FKBP-Lck:SH2 fusion protein is (SEQ. ID. NO. 7).

The term "reporter protein" refers to a protein containing covalent biotin or a noncovalently bound biotinylated ligand. Examples 5 of proteins containing covalent biotin are the C-terminal 87 residues of the biotin carboxy carrier protein of acetyl-CoA carboxylase from Escherichia coli and the biotin-carrier subunit of transcarboxylase from Propionibacterium shermannii. An example of a protein containing a noncovalently bound biotinylated ligand is the tandem SH2 domains of 10 ZAP70 bound to a biotinylated phosphopeptide derived from an Immunoreceptor Tyrosine-based Activation Motif (ITAM) sequence of the human T-cell receptor, the B-cell receptor or a high affinity Immunoglobulin E. (IgE) receptor. Specifically, the Zeta (ζ) 1 sequence of the human T-cell receptor may be utilized. (SEQ. ID. NO. 8) (California Peptide Research Inc., 918 Enterprise Way, Suite 1, Napa, CA 94558)

15

The term "donor-labeled ligand" refers to an organic cryptate-containing molecule loaded with a fluorescent lanthanide metal which binds to the FKBP. An example of a fluorescent 20 lanthanide metal is europium. The europium-cryptate molecule was obtained from CIS Bio International, Subsidiary of Compagnie ORIS INDUSTRIE SA, Boite Postale 175, F30203 Bagnols sur Ceze Cedex, France, is depicted below.

Europium Cryptate (Eu(K))

5

An example of a donor-labeled ligand useful in the instant invention is

The term "acceptor-labeled streptavidin" refers to streptavidin coupled to one or more light harvesting molecules. An example of a light harvesting molecule is allophycocyanin and an example of a acceptor-labeled streptavidin useful in the instant invention is SA-XL665. (CIS Bio International, Subsidiary of Compagnie ORIS INDUSTRIE SA, Boite Postale 175, F30203 Bagnols sur Ceze Cedex, France)

5

10

The term "control assay" refers to the assay when performed in the presence of the donor-labeled ligand, acceptor-labeled streptavidin, and either fusion protein substrate or fusion protein plus biotinylated ligand, but in the absence of the test compound.

The term FK506-binding proteins may include, but are not limited to, the below listed FKBPs and FKBP homologues, which

include a citation to the references which disclose them. This list is not intended to limit the scope of the invention.

yeast NPR1(FPR3) Cardenas et al., *supra*.

Neurospora Galat et al., supra.

A variety of host cells used to produce the FKBP

chimeras may be used in this invention, which include, but are not limited to, bacteria, yeast, bluegreen algae, plant cells, insect cells and animal cells.

Expression vectors are defined herein as DNA sequences that are required for the transcription of cloned copies of genes and the translation of their mRNAs in an appropriate host. Such vectors can be used to express genes in a variety of host cells, such as, bacteria, yeast, bluegreen algae, plant cells, insect cells and animal cells.

Specifically designed vectors allow the shuttling of DNA between hosts such as bacteria-yeast or bacteria-animal cells. An 20 appropriately constructed expression vector may contain: an origin of replication for autonomous replication in host cells, selectable markers, a limited number of useful restriction enzyme sites, a potential for high copy number, and active promoters. A promoter is defined as a DNA 25 sequence that directs RNA polymerase to bind to DNA and initiate RNA synthesis. A strong promoter is one which causes mRNAs to be initiated at high frequency. Expression vectors may include, but are not limited to, cloning vectors, modified cloning vectors, specifically designed plasmids or viruses. Commercially available vectors suitable for FKBP 30 fusion protein expression include, but are not limited to pBR322 (Promega), pGEX (Amersham), pT7 (USB), pET (Novagen), pIBI (IBI), pProEX-1 (Gibco/BRL), pBluescript II (Stratagene), pTZ18R and pTZ19R (USB), pSE420 (Invitrogen), pVL1392 (Invitrogen), pBlueBac (Invitrogen), pBAcPAK (Clontech), pHIL (Invitrogen), pYES2

5

10

15

20

25

30

(Invitrogen), pCDNA (Invitrogen), pREP (Invitrogen) or the like. The expression vector may be introduced into host cells via any one of a number of techniques including but not limited to transformation, transfection, infection, protoplast fusion, and electroporation.

E. coli containing an expression plasmid with the gene for the target or reporter protein fused to FKBP are grown and appropriately induced. The cells are then pelleted and resuspended in a suitable buffer. Although FKBP-12 lacks sequences that specifically direct it to the periplasm, FKBP fusions may be located there and can be released by a standard freeze/thaw treatment of the cell pellet. Following centrifugation, the resulting supernatant contains >80% pure FKBP fusion, which if desired can be purified further by conventional methods. Alternatively, the assay is not dependent on pure protein and the initial periplasmic preparation may be used directly.

A fusion protein which contains a single or multiple SH2 domain(s) may be purified by preparing an affinity matrix consisting of biotinylated phosphopeptide coupled to avidin or streptavidin immobilized on a solid support. A freeze/thaw extract is prepared from the cells which express the fusion protein and is loaded onto the affinity matrix. The desired fusion protein is then specifically eluted with phenyl phosphate.

To assay the formation of a complex between a target protein and its ligand, the biotinylated ligand is mixed with the FKBP fusion protein in a suitable buffer in the presence of the donor-labeled ligand in the well of a black microplate. After a suitable incubation period to allow complex formation to occur, acceptor-labeled streptavidin is added to capture the tagged ligand and any bound fusion protein. The plate is incubated for a sufficient period to allow the capture to go to completion and then the time resolved fluorescent signal is measured. Screening for agonists/antagonists/inhibitors is carried out by performing the initial incubation prior to the acceptor-labeled streptavidin capture step in the presence of a test compound(s) to determine whether they have an effect upon the binding of the

5

10

biotinylated ligand to the fusion protein. This principle is illustrated by Figure 1.

To assay the catalytic activity of a protease, a FKBP fusion protein substrate is combined with the protease in a suitable buffer in the presence of the donor-labeled ligand and acceptor-labeled streptavidin in the well of a black microplate. After a suitable incubation period, the time resolved fluorescent signal of the remaining intact fusion protein substrate is measured. Screening for inhibitors is carried out by performing the incubation in the presence of a test compound(s) to determine whether they have an effect upon the cleavage of the fusion protein substrate. This principle is illustrated by Figures 2 and 3.

10

Scheme 1 depicts the treatment of Compound A, an analog of FK506, with 1 equivalent of p-nitrophenylchloroformate in THF in the presence of a tertiary amine, which gives the p-nitrophenylcarbamate, Compound B. The nitrophenylcarbamate is isolated by silica gel chromatography or used without further purification. The nitrophenylcarbamate is an activated acylating group and will undergo attack by a variety of nucleophiles. The cryptate has two primary amino groups (nucleophiles). Treatment of the p-nitrophenylcarbamate with the europium cryptate in a non-protic

solvent (such as THF) in the presence of a tertiary amine should afford the corresponding urea. Compound C, the cryptate hybrid of the FK506 analog, will be purified by either normal phase silica gel chromatography on prep TLC plates or by reverse phase HPLC chromatography.

The cryptate can be linked to Compound A, other FK506 analogs, and related molecules by a variety of linkages, such as carbamates, amides, ureas, amines, etc. One of ordinary skill in the art would be familiar with the standard procedures used to prepare the FK506 analog containing the cryptate molecule.

The present invention can be understood further by the following examples, which do not constitute a limitation of the invention.

15

10

5

EXAMPLE 1

Process for Preparing the FKBP fusion cloning vector

General techniques for modifying and expressing genes in various host cells can be found in Ausubel, F.M., Brent, R., Kingston, 20 R.E., Moore, D.D., Seidman, J.G., Smith, J.A. and Struhl, K. Current Protocols in Molecular Biology (John Wiley & Sons, New York, New York, 1989). Sequences for a 3'- altered FKBP fragment that contained a glycine codon (GGT) in place of the stop (TGA) codon followed by a sequence encoding a thrombin site (Leu-Val-Pro-Arg) and BamHI 25 restriction site (GGATCC) were amplified using the polymerase chain reaction (PCR). The PCR reaction contained the following primers: 5'-GATCGCCATGGGAGTGCAGGTGGAAACCATCTCCCCA-3' (SEQ. ID. NO. 9) and 5'-TACGAATTCTGGCGTGGATCCAC GCGGAACCAGACCTTCCAGTTTTAG-3' (SEQ. ID. NO. 10) and a 30 plasmid containing human FKBP-12 as the template. The resulting 367 base pair amplification product was ligated into the vector pCRII (Invitrogen) and the ligation mixture transformed into competent Escherichia coli cells. Clones containing an insert were identified using PCR with flanking vector primers. Dideoxy DNA sequencing 35 confirmed the nucleotide sequence of one positive isolate. The altered

338 base pair FKBP fragment was excised from the pCRII plasmid using *Nco*I and *BamH*I and ligated into *Nco*I and *BamH*I digested pET9d (Novagen) plasmid. Competent *E. coli* were transformed with the ligation mixture, and colonies containing the insert were identified using PCR with primers encoding for flanking vector sequences. The FKBP fusion cloning vector is called pET9dFKBPt.

EXAMPLE 2

10 Process for Preparing the FK-ZAP70 fusion expression vector A DNA fragment encoding for the tandem SH2 domains of ZAP70 was prepared by PCR to contain a BamHI site at the 5'-end such that the reading frame was conserved with that of FKBP in the fusion vector. At the 3'-end, the fragment also incorporated a stop codon 15 followed by a BamHI site. The PCR reaction contained Molt-4 cDNA (Clontech) and the following primers: 5'-ATTAGGATCCATGCCAGATCCTGCAGCTCACCTGCCCT-3' (SEQ. ID. NO. 11) and 5'-ATATGGATCCTTACCAGAGGCGTTGCT-3' (SEQ. ID. NO. 12). The fragment was cloned into a suitable vector, sequenced, digested with BamHI, and the insert containing the SH2 20 domains ligated to BamHI treated pET9dFKBPt, and transformed into E. coli. Clones containing inserts in the correct orientation were identified by PCR or restriction enzyme analysis. Plasmid DNA was prepared and used to transform BL21(DE3) cells.

25

5

EXAMPLE 3

Process for Preparing the FK-Syk fusion expression vector

The expression vector for the tandem SH2 domains of Syk fused to FKBP was prepared as in Example 2 except that the PCR reaction contained Raji cell cDNA (Clontech) and the following primers: 5'-CAATAGGATCCATGGCCAGCAGCAGCAGCATGGCTGA-3' (SEQ. ID. NO. 13) and 5'-GACCTAGGATCCCTAATTAACATTTCCCTGTGTGCCGAT-3' (SEQ. ID. NO. 14).

EXAMPLE 4

Process for Preparing the FK-Lck fusion expression vector

The expression vector for the SH2 domain of Lck fused to FKBP was prepared as in Example 2 except that the PCR reaction contained Molt-4 cDNA (Clontech) and the following primers:

5'-ATATGGATCCATGGCGAACAGCCTGGAGCCCGAACCCT-3' (SEQ. ID. NO. 15) and

10 5'-ATTAGGATCCTTAGGTCTGGCAGGGGCGGCTCAACCGTGT GCA-3' (SEQ. ID. NO. 16).

EXAMPLE 5

FK-ZAP70

15

20

25

5

Step A: Process for Expression of FK-ZAP70

E. coli BL21(DE3) cells containing the pET9dFKBPt/
ZAP70SH2 plasmid were grown in Luria-Bertani (LB) media
containing 50 microgram/ml kanamycin at 37 degrees C until the optical
density measured at 600 nm was 0.5-1.0. Expression of the FK-ZAP70
fusion protein was induced with 0.1 mM isopropyl betathiogalactopyranoside and the cells were grown for another 3-5 hr at 30
degrees C. They were pelleted at 4400 x g for 10 min at 4 degrees C
and resuspended in 2% of the original culture volume with 100 mM tris
pH 8.0 containing 1 microgram/ml each aprotinin, pepstatin, leupeptin,
and bestatin. The resuspended pellet was frozen at -20 degrees C until
further purification.

Step B: Process for Purification of FK-ZAP70

The affinity matrix for purification of FK-ZAP70 was prepared by combining agarose-immobilized avidin with excess biotinylated phosphopeptide derived from the ζ1 ITAM sequence of the human T-cell receptor, biotinyl-GSNQLpYNELNLGRREEpYDVLDK, (SEQ. ID. NO. 8) and washing out unbound peptide. Frozen cells containing FK-ZAP70 were thawed in warm water, refrozen on dry ice

for about 25 min., then thawed again. After the addition of 0.1% octyl glucoside, 1 mM dithiothreitol (DTT) and 500 mM NaCl, the extract was centrifuged at 35,000 x g for approximately 30 minutes. The supernatant was loaded onto the phosphopeptide affinity column, at about 4° and washed with phosphate buffered saline containing 1 mM DTT and 0.1% octyl glucoside. FK-ZAP70 was eluted with 200 mM phenyl phosphate in the same buffer at about 37°. The protein pool was concentrated and the phenyl phosphate removed on a desalting column. The purified FK-ZAP70 was stored at about -30° in 10 mM HEPES/150 mM NaCl/1 mM DTT/0.1 mM EDTA/10% glycerol.

EXAMPLE 6

FK-Syk

10

20

E. coli BL21(DE3) cells containing the pET9dFKBPt/ SykSH2 plasmid were grown, induced, and harvested as described in Example 5. FK-Syk was purified using the same affinity matrix and methodology described in Example 5.

EXAMPLE 7

FK-Lck

E. coli BL21(DE3) cells containing the pET9dFKBPt/
LckSH2 plasmid were grown, induced, and harvested as described in
Example 5. The affinity matrix for purification of FK-Lck was prepared by combining agarose-immobilized avidin with excess biotinyl-EPQpYEEIPIYL, (SEQ. ID. NO. 17) and washing out unbound peptide. The remaining methodology for purification was the same as Example 5.

35

EXAMPLE 8

Method of Screening for Inhibitors of FK-ZAP

A DMSO solution of test compound(s) and biotinylphosphopeptide stock solution in a suitable buffer are dispensed into the

wells of a 96-well black microplate. Next, a mixture of FK-ZAP protein and Eu(K)-labeled FK506 analog are added to each test well. Finally, a solution of SA-XL665 is dispensed to each well and the plate is incubated for an appropriate time. The fluorescence ratio is then measured in a Packard Discovery HTRF analyzer. (Packard Instrument Company, 800 Research Parkway, Meridan, CT 06450)

EXAMPLE 9

10 Method of Screening for Inhibitors of Thrombin

5

A DMSO solution of test compound(s) and a suitable buffer containing a mixture of FK-ZAP protein, Eu(K)-labeled FK506 analog, and biotinyl-phosphopeptide are dispensed into the wells of a 96-well black microplate. Next, thrombin is added to each test well. After an appropriate incubation period, a solution of SA-XL665 is dispensed to each well. The fluorescence ratio is then measured in a Packard Discovery HTRF analyzer. (Packard Instrument Company, 800 Research Parkway, Meridan, CT 06450)

SEQUENCE LISTING

- (1) GENERAL INFORMATION
- (i) APPLICANT: HERMES, JEFFREY D. SALOWE, SCOTT P. SINCLAIR, PETER J.
- (ii) TITLE OF THE INVENTION: A HIGH THROUGHPUT ASSAY USING FUSION PROTEINS
- (iii) NUMBER OF SEQUENCES: 17
- (iv) CORRESPONDENCE ADDRESS:
 - (A) ADDRESSEE: Merck & Co., Inc.

- (xi) SEQUENCE DESCRIPTION: SEQ ID NO:17:

Glu Pro Gln Xaa Glu Glu Ile Pro Ile Tyr Leu 5 10

WHAT IS CLAIMED IS:

1. A method of screening for compounds capable of binding to a fusion protein which comprises the steps of:

- a) mixing a test compound, a biotinylated ligand, the fusion protein, a donor-labeled ligand and acceptor-labeled streptavidin;
- b) incubating the mixture for a suitable time period;
- c) measuring the time-resolved fluorescence attributable to the binding of the biotinylated ligand to the fusion protein in the presence of the test compound; and
- d) determining the binding of the biotinylated ligand to the fusion protein in the presence of the test compound relative to a control assay run in the absence of the test compound.

15

10

5

2. The method of screening for compounds capable of binding to a fusion protein, as recited in Claim 1, wherein the acceptor-labeled streptavidin consists of streptavidin coupled to a light harvesting molecule.

20

- 3. The method of screening for compounds capable of binding to a fusion protein, as recited in Claim 2, wherein the acceptor-labeled streptavidin consists of SA-XL665.
- 4. The method of screening for compounds capable of binding to a fusion protein, as recited in Claim 3, wherein the donor-labeled ligand comprises a cryptate-containing molecule coupled to a lanthanide metal.
- 5. The method of screening for compounds capable of binding to a fusion protein, as recited in Claim 4, wherein the donor-labeled ligand is selected from the group consisting of a Eu(K)-labeled analog of FK506 or and Eu(K)-labeled analog of rapamycin.

6. The method of screening for compounds capable of binding to a fusion protein, as recited in Claim 5, wherein the donor-labeled ligand is an Eu(K)-labeled analog of FK506.

5 7. The method of screening for compounds capable of binding to a fusion protein, as recited in Claim 6, wherein the donor-labeled ligand is

- 8. The method of screening for compounds capable of binding to a fusion protein, as recited in Claim 7, wherein the fusion protein comprises an FK506 binding protein, peptide linker and target protein.
- 9. The method of screening for compounds capable of binding to a fusion protein, as recited in Claim 8, wherein the FK506 binding protein is 12kDA human FK506 binding protein.

10. The method of screening for compounds capable of binding to a fusion protein, as recited in Claim 9, wherein the target protein is selected from tyrosine phosphatases, nuclear receptors, bacterial tRNA synthetases or single and multiple signal transduction domains.

- 11. The method of screening for compounds capable of binding to a fusion protein, as recited in Claim 10, wherein the target protein comprises a single or multiple signal transduction domain.
- 12. The method of screening for compounds capable of binding to a fusion protein, as recited in Claim 11, wherein the single or multiple signal transduction domain is selected from the group consisting of: SH1, SH2, SH3 and PH domains.
- 13. The method of screening for compounds capable of binding to a fusion protein, as recited in Claim 12, wherein the target protein is a single or multiple SH2 domain.

20

5

10

15

14. The method of screening for compounds capable of binding to a fusion protein, as recited in Claim 13, wherein the target protein is a single or multiple SH2 domain selected from the group consisting of: ZAP70:SH2, Syk:SH2 and Lck:SH2.

25

- 15. The method of screening for compounds capable of binding to a fusion protein, as recited in Claim 14, wherein the target protein is the SH2 domain, ZAP70:SH2.
- 30 16. The method of screening for compounds capable of binding to a fusion protein, as recited in Claim 14, wherein the target protein is the SH2 domain, Syk:SH2.

17. The method of screening for compounds capable of binding to a fusion protein, as recited in Claim 14, wherein the target protein is the SH2 domain, Lck:SH2.

- 5 18. A method of screening for compounds capable of inhibiting a protease which comprises the steps of:
 - a) mixing a test compound, a fusion protein substrate, a donor-labeled ligand, acceptor-labeled streptavidin, and a protease;
- b) incubating the mixture for an appropriate time;
 - c) measuring the time-resolved fluorescence attributable to the binding of the intact fusion protein substrate to the acceptor-labeled streptavidin in the presence of the test compound; and
- d) determining the binding of the intact fusion protein substrate to the acceptor-labeled streptavidin in the presence of the test compound relative to a control assay run in the absence of the test compound.
- 19. The method of screening for compounds capable of inhibiting a protease, as recited in Claim 18, wherein the protease is selected from the group consisting of thrombin, HIV or TNFα converting enzyme.
- 25 20. The method of screening for compounds capable of inhibiting a protease, as recited in Claim 19, wherein the protease is thrombin.
- 21. The method of screening for compounds capable of inhibiting a protease, as recited in Claim 20, wherein the acceptor-labeled streptavidin consists of streptavidin coupled to a light harvesting molecule.

22. The method of screening for compounds capable of inhibiting a protease, as recited in Claim 21, wherein the acceptor-labeled streptavidin consists of SA-XL665.

- 5 23. The method of screening for compounds capable of inhibiting a protease, as recited in Claim 22, wherein the donor-labeled ligand comprises a cryptate-containing molecule coupled to a lanthanide metal.
- 10 24. The method of screening for compounds capable of inhibiting a protease, as recited in Claim 23, wherein the donor-labeled ligand is selected from the group consisting of an Eu(K)-labeled analog of FK506 or and Eu(K)-labeled analog of rapamycin.
- 15 25. The method of screening for compounds capable of inhibiting a protease, as recited in Claim 24, wherein the donor-labeled ligand is an Eu(K)-labeled analog of FK506.
- 26. The method of screening for compounds capable of inhibiting a protease, as recited in Claim 25, wherein the donor-labeled ligand is

- 27. The method of screening for compounds capable of inhibiting a protease, as recited in Claim 26, wherein the fusion protein comprises an FK506 binding protein, peptide linker and reporter protein.
- 28. The method of screening for compounds capable of inhibiting a protease, as recited in Claim 27, wherein the FK506 binding protein is 12kDA human FK506 binding protein.
- 29. The method of screening for compounds capable of inhibiting a protease, as recited in Claim 28, wherein the reporter protein is selected from the group consisting of SH2 domains or covalently biotinylated proteins.

30. The method of screening for compounds capable of inhibiting a protease, as recited in Claim 29, wherein the covalently biotinylated protein is selected from the group consisting of the C-terminal 87 residues of the biotin carboxy carrier protein of acetyl-CoA carboxylase from *Escherichia coli* or the biotin-carrier subunit of transcarboxylase from *Propionibacterium shermannii*.

- 31. The method of screening for compounds capable of inhibiting a protease, as recited in Claim 29, wherein the SH2 domain is
 the ZAP70 bound to a biotinylated phosphopeptide derived from an ITAM sequence.
- 32. The method of screening for compounds capable of inhibiting a protease, as recited in Claim 31, wherein the ITAM
 15 sequence is selected from the group consisting of the human T-cell receptor, the B-cell receptor or a high affinity IgE receptor.
- 33. The method of screening for compounds capable of inhibiting a protease, as recited in Claim 32, wherein the ITAM
 20 sequence is the Zeta 1 sequence of the human T-cell receptor. (SEQ. ID. NO. 8)

INTERNATIONAL SEARCH REPORT

v. e.s

International application No. PCT/US98/04610

A. CLASSIFICATION OF SUBJECT MATTER IPC(6) :G01N 33/53, 33/544, 33/531 US CL :435/7.1, 7.5; 436/529, 543							
According to International Patent Classification (IPC) or to both national classification and IPC							
	LDS SEARCHED						
	locumentation searched (classification system follower 435/7.1, 7.5; 436/543	d by classification symbols)					
Documental	Documentation scarched other than minimum documentation to the extent that such documents are included in the fields searched						
	Electronic data base consulted during the international search (name of data base and, where practicable, search terms used) APS, DIALOG, GENBANK, BIOTECHDS, BIOSIS, CA, MEDLINE, LIFESCI
